

ABSTRACT OF THE DISCLOSURE

A voice recognition operation system and a method for operating the same are disclosed wherein a verbal input is compared with a recognition word set stored in a memory 8 which stores correlated interactive operational patterns to select a pertinent recognition word set and interactive operational pattern, with the selected data being displayed over a speaker 5 and a display 3. A new mode recognition mode setting device 7 enables setting of a new registering mode in which an input section 1, 2, 7 enables inputting of various information into the memory 8, and a setting section 9 enables setting of a new recognition word set and an interactive operational pattern, to be used for new voice recognition operational purpose, on the basis of various information in the presence of the new registering mode. A registering section 9 registers the preset resultant data in the memory 8.
